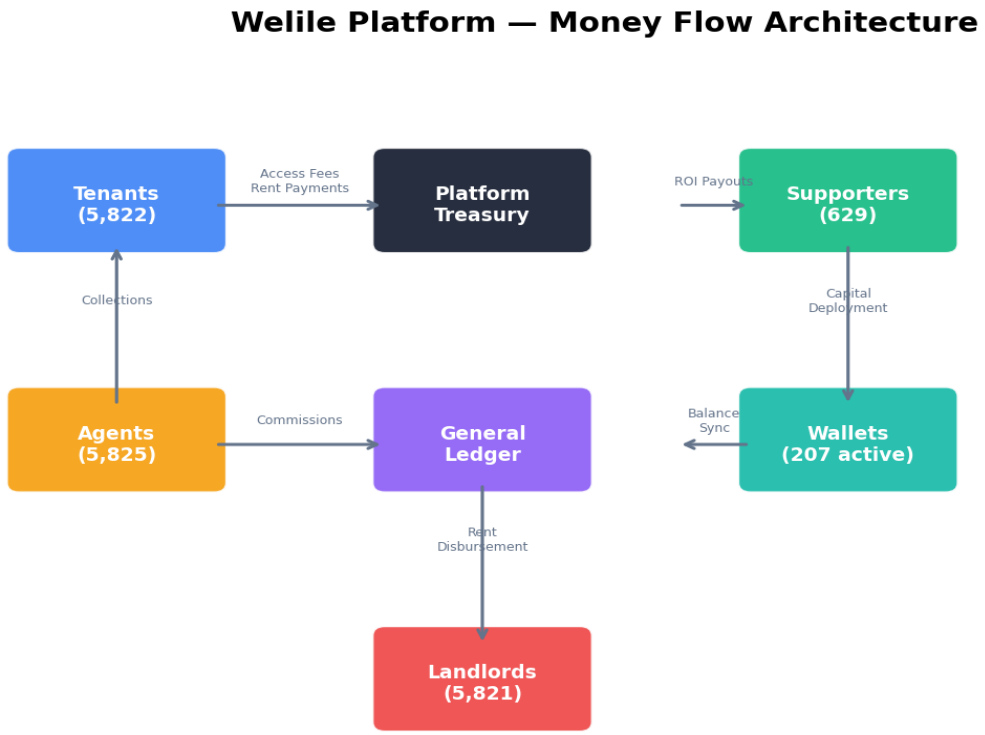
13. User Ecosystem Overview
14. Security & Audit Controls

1. Executive Summary & Key Performance Indicators

Welile Technologies operates a rent facilitation platform connecting tenants, agents, supporters (funders), and landlords through a regulated financial ecosystem. Every shilling is tracked via a production-grade double-entry general ledger with 32 locked categories, three ledger scopes (wallet, platform, bridge), and four data classifications (production, legacy_real, test_dev, admin_correction).

KPI	Value	Scope
Total Capital Deployed	UGX 2,672,157,874	Investor Portfolios
Active Portfolios	453	Supporter Accounts
Wallet Balances (207 wallets)	UGX 2,557,762,313	All User Wallets
Rent Requests Funded	42 (UGX 15.36M)	Rent Pipeline
Production Ledger Txns	7,932	General Ledger
Total Registered Tenants	5,822	User Base
Total Registered Agents	5,825	User Base
Total Supporters	629	Partner Network
Total Landlords	5,821	Property Network
ROI Expense (Paid Out)	UGX 29,294,478	Production Ledger
Wallet Withdrawals	UGX 59,385,195 (1,170 txns)	Production Ledger

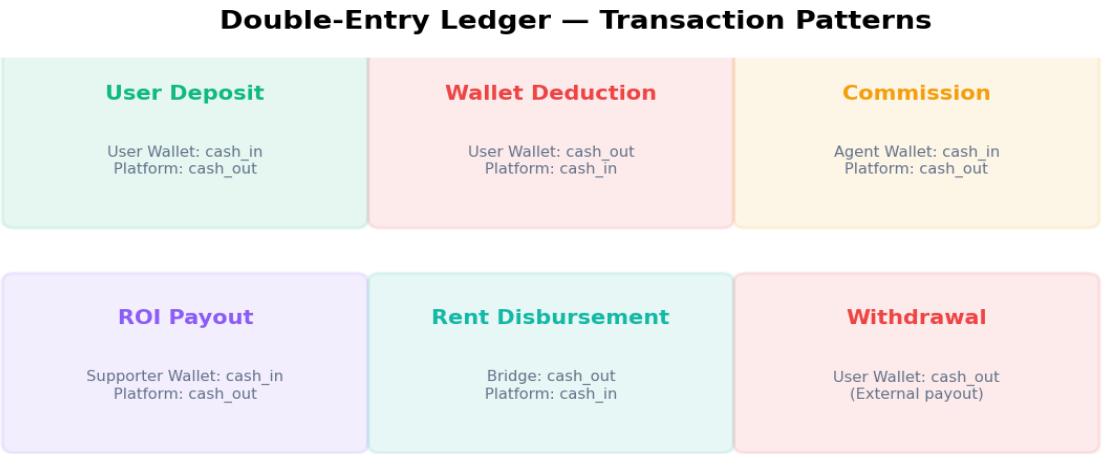
2. Platform Money Flow Architecture



How Money Enters the System: Capital flows in through three primary channels: (1) **Supporter Investments** — partners deposit capital via Mobile Money, Bank Transfer, or Agent Cash into investor portfolios; (2) **Tenant Payments** — access fees, registration fees, and rent repayments collected by agents or via digital channels; (3) **Agent Float Funding** — operational capital loaded into agent wallets for field disbursements.

How Money Exits the System: Outflows include: (1) **Rent Disbursements** to landlords via agent float or direct MoMo; (2) **ROI Payouts** to supporter wallets based on flat monthly rates; (3) **Wallet Withdrawals** — users cash out via Mobile Money; (4) **Agent Commissions** earned per successful rent facilitation; (5) **GAAP Operational Expenses** (payroll, marketing, admin).

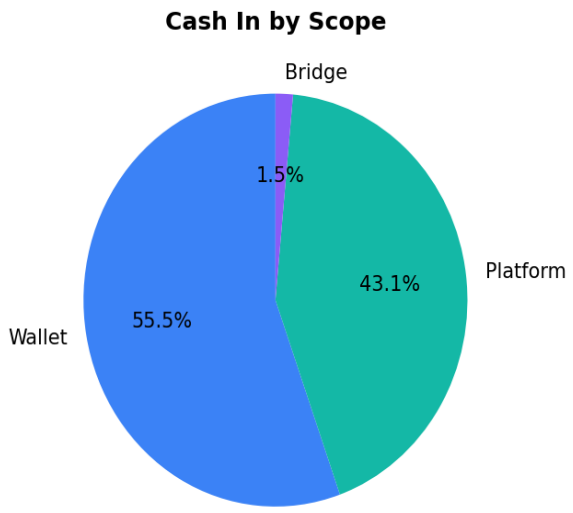
3. Double-Entry Ledger System

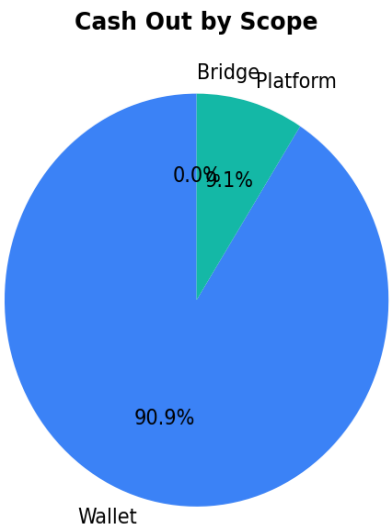


Every financial transaction in Welile is recorded as a balanced double-entry group where **SUM(cash_in) == SUM(cash_out)**. The create_ledger_transaction RPC enforces atomic writes, deterministic idempotency, and mandatory source_table traceability.

Transaction	Leg 1 (cash_in)	Leg 2 (cash_out)	Example Amount
User Deposit	User Wallet	Platform (liability)	UGX 500,000
Wallet Deduction	Platform (revenue)	User Wallet	UGX 50,000
Agent Commission	Agent Wallet	Platform (expense)	UGX 15,000
ROI Payout	Supporter Wallet	Platform (expense)	UGX 300,000
Rent Disbursement	Bridge Scope	Platform Treasury	UGX 400,000
Partner Funding	Platform (capital)	Platform (obligation)	UGX 5,000,000
Wallet Withdrawal	— (external)	User Wallet	UGX 200,000

4. Ledger Scope Model





The general ledger partitions every entry into one of three scopes, automatically assigned by the auto_assign_ledger_scope trigger:

- **Wallet Scope** — Tracks individual user wallet balances. Cash In: UGX 166.8M, Cash Out: UGX 329.0M. This scope drives the wallets table via balance-sync triggers.
- **Platform Scope** — Represents the platform's own treasury and obligations. Cash In: UGX 129.6M, Cash Out: UGX 32.8M. Platform revenue, expenses, and capital movements live here.
- **Bridge Scope** — Temporary holding for rent receivables during the facilitation cycle. Cash In: UGX 4.4M. Entries here represent rent_receivable_created awaiting collection.

5. Locked Category Governance (32 Production Categories)

The platform enforces a strict allowlist of 32 ledger categories. Any category outside this list is **hard-rejected** by both the create_ledger_transaction RPC and the database-level validation trigger. This ensures every shilling is traceable and classifiable.

Group	Categories	Purpose
Revenue	access_fee_collected, registration_fee_collected	Platform earnings from tenant fees
Cash In	wallet_deposit, tenant_repayment, agent_repayment, partner_funding, share_capital	External money entering the system
Rent Engine	rent_disbursement, rent_receivable_created, rent_principal_collected	Rent facilitation lifecycle
ROI System	roi_expense, roi_wallet_credit, roi_reinvestment	Supporter returns calculation & payout
Commissions	agent_commission_earned, agent_commission_withdrawal, agent_commission_used_for_rent	Agent earnings & usage
Wallet Ops	wallet_withdrawal, wallet_transfer, wallet_deduction	User wallet movement
GAAP Expenses	marketing, payroll, admin, R&D, tax, interest, equipment	Operational cost tracking
System	system_balance_correction, orphan_reassignment, orphan_reversal	Audit & reconciliation
Agent Float	agent_float_deposit, agent_float_used_for_rent	Field operational capital
Portfolio	pending_portfolio_topup	Mid-cycle investment parking

6. Revenue Recognition & Billing Engine

Welile recognizes revenue using **Proportional Revenue Recognition** — revenue is recorded incrementally as it is actually collected, not when a rent request is approved. This follows conservative accounting principles.

Revenue Streams:

- **Access Fees** (access_fee_collected): Charged per rent facilitation cycle. Production total: UGX 9,704 across 6 transactions.
- **Registration Fees** (registration_fee_collected): One-time onboarding fee. Production total: UGX 664 across 4 transactions.

Auto-Charge Engine: Daily deductions from tenant wallets for active rent obligations. A 72-hour grace period is provided before the system triggers Float-First Recovery — deducting from the linked agent's wallet.

Example Flow:

1. Tenant requests UGX 400,000 rent → Access fee (UGX 20,000) + Registration fee (UGX 5,000) calculated
2. Request approved → rent_disbursement (cash_out, platform) + rent_receivable_created (cash_in, bridge)
3. Daily auto-charge: wallet_deduction (cash_out, tenant wallet) → split into rent_principal_collected + access_fee_collected
4. If tenant wallet empty after 72h → agent float deducted via agent_float_used_for_rent

7. Supporter (Partner) Capital Lifecycle

Supporters provide the capital that funds rent facilitation. The system manages 453 active portfolios with UGX 2.67 Billion in total deployed capital.

Investment Flow:

1. **Deposit**: Supporter deposits via MoMo/Bank/Agent → wallet_deposit (cash_in, wallet) + partner_funding (cash_in, platform)
2. **Portfolio Creation**: Capital allocated to investor_portfolios table → status: 'active'
3. **ROI Accrual**: Flat monthly rate per 30-day cycle (e.g., 15% or 20% of principal)
4. **ROI Payout**: roi_expense (cash_out, platform) + roi_wallet_credit (cash_in, supporter wallet). Production total paid: UGX 29.3M
5. **Reinvestment**: Supporter can compound via roi_reinvestment (cash_in, portfolio). Total reinvested: UGX 9.1M
6. **Withdrawal**: 90-day notice period mandatory. wallet_withdrawal (cash_out, wallet) → external MoMo payout

Mid-Cycle Top-ups are parked in pending_portfolio_topup and do not earn ROI until the next payout cycle.

8. Agent Commission & Float System

Agents are the field workforce that collects payments, delivers rent, and onboards tenants. They earn commissions and manage operational float.

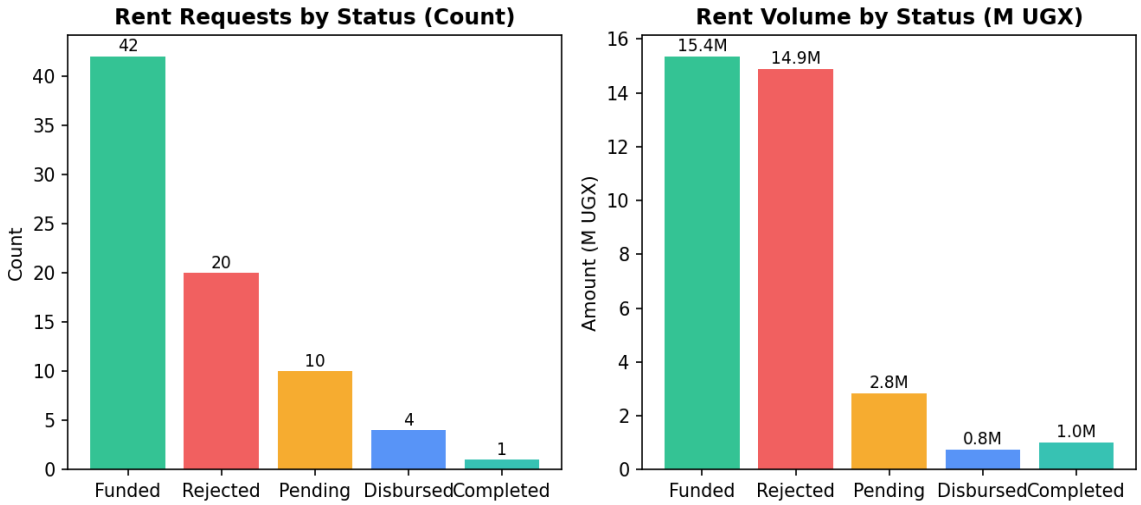
Commission Model:

- agent_commission_earned: Cash_in to agent wallet + Cash_out from platform. Total: UGX 571,000 (24 txns)
- Agents can use commissions for: (1) Withdrawal, (2) Pay tenant rent, (3) Accumulate
- Agent is financial guarantor for all onboarded tenants — defaults trigger agent wallet deduction

Float System:

- agent_float_deposit: Loaded by operations for field rent deliveries
- agent_float_used_for_rent: Deducted when agent delivers rent to landlord. Total: UGX 1.37M (23 txns)
- Float balance tracked via agent_landlord_float table with real-time GPS verification on deliveries

9. Rent Facilitation Pipeline



6-Stage Approval Pipeline:

1. **Pending** (10 requests, UGX 2.82M) — Tenant submits rent request
2. **Funded** (42 requests, UGX 15.36M) — Capital allocated from supporter pool
3. **Disbursed** (4 requests, UGX 750K) — Agent delivers cash to landlord with GPS + photo proof
4. **Completed** (1 request, UGX 1M) — Repayment cycle finished
5. **Rejected** (20 requests, UGX 14.87M) — Failed verification or policy check

Ledger Entries per Rent Cycle: rent_disbursement → rent_receivable_created → daily auto-charge → rent_principal_collected + access_fee_collected + registration_fee_collected

10. Wallet Operations & Withdrawal Governance

207 active wallets hold a combined balance of **UGX 2,557,762,313**. Wallet balances are never directly modified — they are exclusively driven by ledger-scope triggers.

Deposit Channels: Mobile Money (MTN/Airtel), Bank Transfer, Agent Cash, Direct Cash

Withdrawal Pipeline:

- User submits withdrawal → Pending → Operational Approval → Financial Ops Verification → External MoMo payout
- Total withdrawals processed: UGX 59.4M across 1,170 transactions
- Supporters face mandatory 90-day notice period for capital withdrawal

Wallet Transfers: UGX 2.38M moved between user wallets (58 transactions)

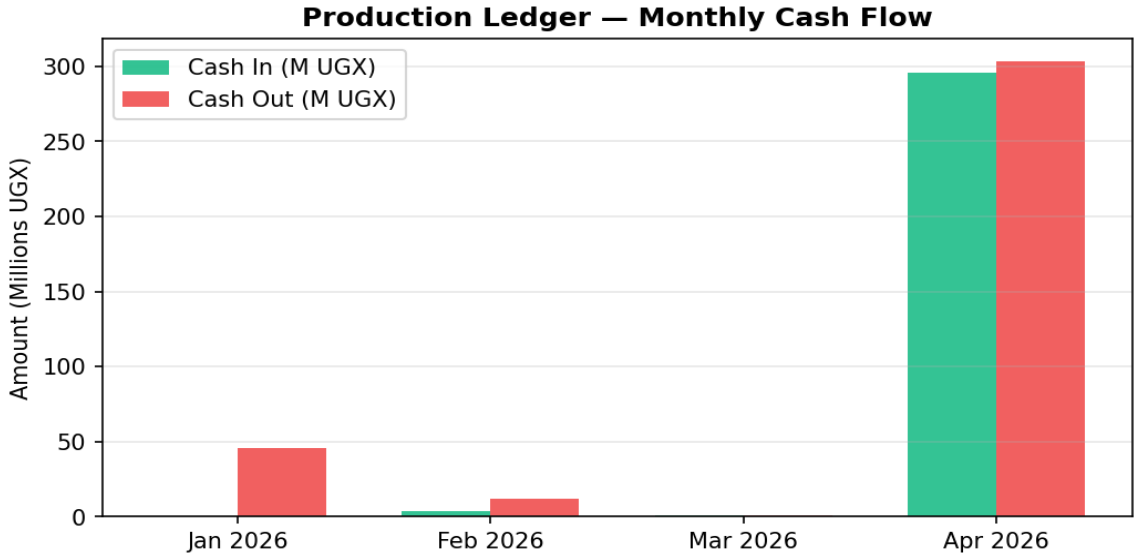
Referral Bonuses: UGX 2.64M credited to 5,289 referral events

11. GAAP Expense Tracking

The platform tracks operational expenses using standard GAAP categories in the production ledger. These are recorded as cash_out entries against the platform scope.

Category	Ledger Key	Status
Marketing	marketing_expense	UGX 3,000 (2 txns)
Payroll	payroll_expense	Configured, no production entries yet
General & Admin	general_admin_expense	Configured
Research & Development	research_development_expense	Configured
Tax	tax_expense	Configured
Interest	interest_expense	Configured
Equipment	equipment_expense	Configured

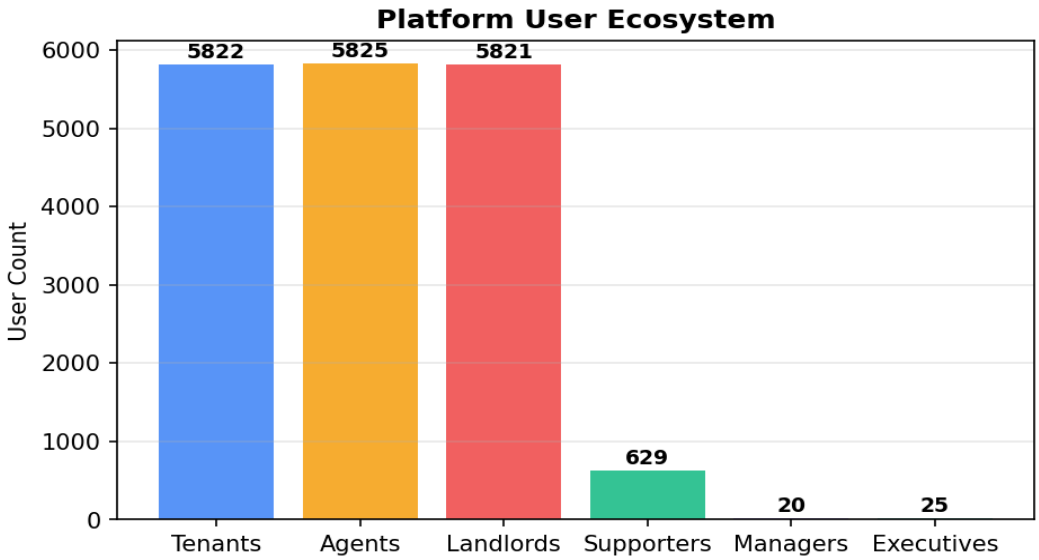
12. Monthly Production Trends



Key Observations:

- **January 2026**: Significant system corrections (UGX 45.7M cash out) — initial production ledger setup
- **February 2026**: Stabilization with 6,055 transactions. Cash out: UGX 12.2M
- **March 2026**: Low activity month. Near-balanced: UGX 974K in vs UGX 851K out
- **April 2026**: Major scaling — UGX 296M in / UGX 303M out. Partner funding and system corrections dominate

13. User Ecosystem Overview



The platform operates with near-symmetric user counts across tenants (5,822), agents (5,825), and landlords (5,821), reflecting the 1:1:1 matching model. 629 supporters provide the capital base, managed by 20 managers and 25 executives across CEO, COO, CFO, CTO, CMO, and CRM roles.

14. Production Category Volume Analysis

15. Security & Audit Controls

4-Layer Ledger Security Fortress:

1. **Session Authorization**: Mandatory ledger.authorized flag set before any write
2. **Deny-All RLS**: Row Level Security blocks all direct table access
3. **Permission Revocation**: INSERT/UPDATE/DELETE revoked from all roles on ledger tables
4. **Strict Mode**: validate_ledger_category trigger rejects unapproved categories

Separation of Financial Authority:

- **CFO**: Inbound/Strategic — ROI approvals, manual credits/debits, clawback authority (skip_balance_check)
- **Financial Operations**: Outbound/Verification — deposit verification, withdrawal processing
- **All payouts** require CFO approval before wallet credit, except direct CFO corrections

Data Classifications:

Classification	Cash In	Cash Out	Txn Count	Purpose
production	UGX 300.8M	UGX 361.8M	7,932	Live operational data
legacy_real	UGX 3,068.6M	UGX 233.0M	3,093	Pre-migration real data
test_dev	UGX 124.9M	UGX 211.4M	686	Testing & development
admin_correction	UGX 23.8M	UGX 136.9M	57	Manual adjustments
